Valuation of single residential land

What

This policy guides valuers on the methods to use, and factors to consider, when valuing single residential land for rating and taxing purposes.

How

Under this policy, valuers use mass valuation methods based on specific assumptions and considerations.

Valuers must also apply market evidence and do ongoing quality reviews to support valuations.

Valuers assess the value of the land only, without including the value of structures or other improvements on that land.

Why

This policy will ensure that the Valuer General's valuations of single residential land are:

- consistent and accurate
- transparent
- in line with the *Valuation of Land Act 1916* (Valuation of Land Act).

1 Policy

1.1 Scope

Single residential land dwelling Use this policy to assess the value of single residential land. Single residential land is an allotment that is, or could be, developed for a single residential or dual occupancy dwelling.

Land value improvement land improvement The land value excludes any structures or improvements, but includes land improvements. See section 6A of the *Valuation of Land Act 1916* (Valuation of Land Act).

1.2 Valuation methods

Mass valuation process The Valuer General uses a mass valuation process to value most single residential land. It involves the systematic valuation of groups of properties at a given date using standardised procedures. Mass valuations must also meet the requirements of the Valuation of Land Act. Section 6A of the Valuation of Land Act applies for most single residential land valuations. All valuations must be supported by market evidence and quality assured. The mass valuation method used in NSW is the component method. Valuation methods, such as the direct comparison method, are used to value a sample of individual properties within the component.

Component method The group of properties used for mass valuation is called a component. These properties have similar attributes, such as location, size and amenity, and are expected to experience similar changes in market value. Single residential components contain land zoned for single residential use. When using the component method, you must select properties from each component as the primary benchmark and reference benchmarks. The primary benchmark is individually valued each year

based on real estate market sales evidence to determine how much the land value has changed from the previous year. The rate of change recorded for the primary benchmark is then applied to the other properties in the component.

Reference benchmarks are selected from within the component and used to check the quality of the proposed valuations. Reference benchmarks are important for checking the accuracy of the mass valuation process.

Benchmarks must represent the range of properties in a component, and their valuations must be supported by market evidence.

Primary benchmark
median

For your primary benchmark:

- base it on a property that is within five per cent of the component's median land value
- use direct comparison to value it at 1 July each year and calculate the rate of change from the prior year's 1 July land value

The rate of change is called the component factor.

Reference benchmarks
handcraft
quartile
subfactor

Choose reference benchmarks with values further away from the median land value (upper and lower quartiles). Then:

- value these at 1 July and check your valuations against the primary benchmark's rate of change
- determine if subgroups of properties have had changes in value inconsistent with most of the component.

If you find inconsistencies with your reference benchmarks, you may need to handcraft valuations for some properties or create a component subfactor.

Component factor

Use the component factor, derived from your primary benchmark, to value other properties in the component. Apply it to each property in the component, except for handcrafted valuations or those valuations which have been valued using a component subfactor.

Handcrafted and subfactor values override component factor values.

Direct comparison

Direct comparison involves comparing market sales with the subject land.

When using direct comparison to value single residential land, you must:

- consider a broad range of market evidence, including sales of vacant and improved land
- follow an evidence-based approach when using sales of improved land to deduce the land value (see 1.4 for sales analysis)
- consider all factors that influence the land’s value such as the land’s size, aspect, location, zoning, planning controls, demographics and permitted use.

1.3 Assumptions and considerations

Valuation assumptions

- unencumbered
- fee simple in possession
- highest and best use sale

In line with section 6A of the Valuation of Land Act, you must value the land at its highest and best use, while assuming:

- there is a sale of land
- the buyer and seller are hypothetical
- the title is unencumbered, and the valuation is of the full fee simple in possession
- the land is vacant and has no improvements other than land improvements
- there is no existing development consent for the land.

Valuation considerations

- date the valuation was made
- statutory restrictions

You must also consider and reflect in the valuation these other requirements:

- the current use of the property if it differs from planning controls and would, if allowed, result in a higher land value (section 6A(2))
- all statutory restrictions on the land
- the valuation reflects a sale of the property at 1 July of the valuing year (section 14B)
- the property’s physical condition, surroundings, zoning and allowable uses that applied on the date the valuation was made (section 14K).

Further considerations

The land value of single residential land may be affected by other sections of the Valuation of Land Act or other legislation. Examples that may be relevant are listed below.

Valuation of Land Act	section 14L section 14T Division 5 and 5A section 14G
Local Government Act 1993	section 585

Land Tax Management Act 1956	sections 9C and 9D section 62K
Heritage Act 1977	sections 123-125

1.4 Sales analysis

Wide analysis of sales evidence

You must analyse enough market sales to establish or verify land values at 1 July in the valuing year. Make sure you cover the breadth of the market, and not just sales of vacant land or sales relating to benchmark properties.

Analyse a wide range of sales evidence in all components to ensure adequate quality assurance across the whole range of property values.

To deduce the land value of an improved property, use an evidence-based approach to remove the added value of improvements from the sale price. The added value is not the replacement or insurance value of the improvements.

Where a sale includes improvements that add no value to the land and are to be removed, the demolition and removal costs of those improvements are to be added to the sale price.

Paired sales approach for improved land

added value of improvements

Use a paired sales approach to work out the value that improvements, such as buildings, add to the land. Do this by comparing the difference between sales of improved land and sales of vacant or lightly improved land.

Example

A property with a three-bedroom dwelling sold for \$750,000. The land was valued at \$500,000 by direct comparison with vacant land sales. Therefore the added value of improvements is \$250,000.

Use your analysis of the added value of improvements by applying it to other sales of improved properties to work out the residual land value.

Include in your analysis a wide range of sales that show the added values of different improvements, including those of varying age.

This type of analysis will capture the added value of any:

- developer's margin
- building improvements and internal inclusions, air conditioning, fencing, paths, driveways, pools and landscaping
- professional fees, council approval fees and holding costs.

Valuation date adjustment

valuing year

If the sales you are analysing are earlier or later than 1 July, adjust the sale price to reflect market values at 1 July.

Ways to estimate market movement between the two dates include:

1. Sales and resales	<p>Look at sales and resales of properties for the period to work out the market movement. Use this to calculate a monthly movement rate to apply to other sales.</p> <p>Take care to also consider other factors affecting value, such as property improvements made since the original sale.</p>
2. Median values	<p>Refer to sources that publish changes in median residential property prices.</p> <p>Be careful if there have been few sales in the area, as the type of sales that took place may distort the figures.</p>
3. Rental analysis	<p>Look at rental prices to gauge the market movement, especially over the long term.</p> <p>Be aware, though, that returns on property may fluctuate and so the relationship between rental prices and market values may change.</p>
4. Track price movements	<p>Analyse sales of comparable properties over time to track price movements.</p>

1.5 Quality control

Ongoing quality reviews

Mass valuation processes aim to provide reliable and consistent valuations that lie within the market range. However, they also have limitations, especially when used over time or for valuing properties that are complex or lack comparable market evidence.

You must implement quality assurance processes and ongoing reviews of single residential land values and property

attributes to:

- ensure consistency in the values
- correct any valuations that have moved out of market range.

Review sample land values individually and as a group to ensure that they can be tested and supported against the available market evidence.

Quality assurance measures

Tools that you should apply to measure the quality of your valuations include:

- individual land value reviews (verification)
- statistical tests
- valuation process reviews.

Verification

Verification is the name given to the process of systematically reviewing individual land values, based on risk.

Verification must be completed with an understanding of the physical and market factors that influence value. You must have sufficient knowledge of the property to determine that the property is correctly valued.

2.1 Definitions

added value of improvements	The value that improvements add to the land. It is determined by comparing market evidence for land with improvements to that for vacant or lightly improved land.
component	A group of properties, used for mass valuation, whose market values move uniformly. It is also known as a 'sub-market group' or 'sales group' in other Australian jurisdictions.
date the valuation is made	The actual date on which the valuer performs the valuation. The physical condition of the land and the manner in which it may be used on the date the valuation is made must be assumed to be the same as at 1 July. See section 14K of the Valuation of Land Act.
dwelling	'A room or suite of rooms occupied or used, or so constructed or adapted as to be capable of being occupied or used as a separate domicile'. (Standard Instrument – Principal Local Environmental Plan) A dual occupancy dwelling is two domiciles on one allotment.
environmental planning instrument	A legal document that regulates land use and development under state environmental planning policies and local environmental plans.
fee simple in possession	Absolute title to land, free of any other claims against the title, which one can sell or pass to another by will or inheritance.
handcraft	Individually value a property based on market evidence.
highest and best use	Valuation concept that refers to the possible use of a property that would give the highest market value. The use must be lawful, physically possible and financially feasible.
improvement	Something that improves the value of the land. This is not defined in the Valuation of Land Act, and is different from the term 'land improvement' (below).
land improvement	Land improvement, such as draining, excavating, filling or clearing, as defined in section 4 of the Valuation of Land Act and included in the land value.

land value	Value of the land excluding any structures or improvements, but including land improvements. See section 6A of the Valuation of Land Act for a full explanation.
median	The median land value or median sale price is the half-way value in a series of land values or sale prices from lowest to highest value.
primary benchmark	An individually valued property that represents the majority of properties in a component. The primary benchmark should be within 5 per cent of the median value in a component. It is used to calculate the component factor.
quartile	A statistical term describing a division of observations into four equal intervals based upon the values of the data.
reference benchmark	An individually valued property used to check the quality of proposed valuations in a component. It is used only as a quality check for the application of mass valuation, and not to calculate the component factor.
sale	The transfer of property between parties. To use a sale as market evidence, it must have been: <ul style="list-style-type: none">• an arm's length transaction• between a willing buyer and willing seller who both acted knowingly, prudently and without compulsion• properly marketed.
statutory restrictions	Statutory restrictions on the land may include environmental planning instruments and development control plans, as well as restrictions relating to the clearing of land, water and soil management.
subfactor	A subfactor is any factor other than the component factor used to value sub groups of properties that have experienced value movements which are inconsistent with the majority of the component.
unencumbered	Unencumbered land is land without any encumbrances. An encumbrance is any right to or interest in land by someone other than the owner, and that prevents the transfer of that land or lowers its value. It might include an easement, restrictive covenant, mortgage, or other restriction.
valuing year	The year starting 1 July. Valuation reflects the property market at the start of the valuing year.

2.2 Laws and policies

**Governing NSW
law**

Valuation of Land Act 1916 (Valuation of Land Act)
Section 6A

3 Context

3.1 Role of the Valuer General

The Valuer General for NSW

In NSW, the Valuation of Land Act 1916 establishes the Valuer General as the independent statutory authority responsible for ensuring the integrity of land valuations in NSW.

Valuation Services, Property NSW manages the valuation system on behalf of the Valuer General, outsourcing the majority of valuation services to private valuation firms.

The Valuer General is committed to an open and transparent valuation process that is easy for landholders to understand.

3.2 Background

Mass valuation methods

Mass valuation improves cost efficiencies, because it allows a small number of valuations to be used for a large number of properties.

Mass valuation is used increasingly around Australia and the world, especially to value single residential properties for rating and taxing purposes.

Different mass valuation methods

In NSW, valuers who do valuations for the Valuer General all currently use the component method.

A number of other mass valuation methods are used in Australia and around the world and alternative methods may be acceptable for use in NSW. You must seek the Valuer General's approval to use any alternative valuation method.
